**VAKSIMUNE® IBH Duo**

# VAKSIMUNE® IBH Duo

**Inclusion Body Hepatitis (IBH)** is a disease caused by fowl adenovirus and characterized by acute mortality and severe anemia. This disease often causes a sudden death without showing any signs in poultry.

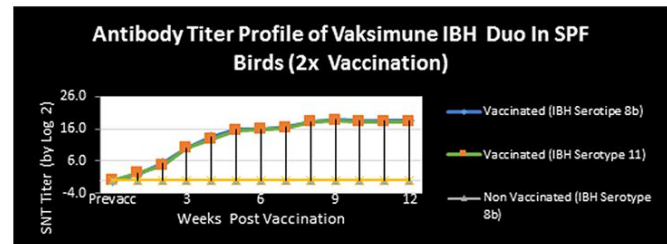

**Vaksimune® IBH Duo** is an inactivated Fowl Adenovirus serotype 8b & 11 vaccine. The viruses are inactivated and emulsified in oil adjuvant, so it can induce a high and a long-lasting immunity and does not cause any side effect. It has proven by a trial that **Vaksimune® IBH Duo** can create protective immunity up to 10 weeks after vaccination.

## OUTSTANDING FEATURES

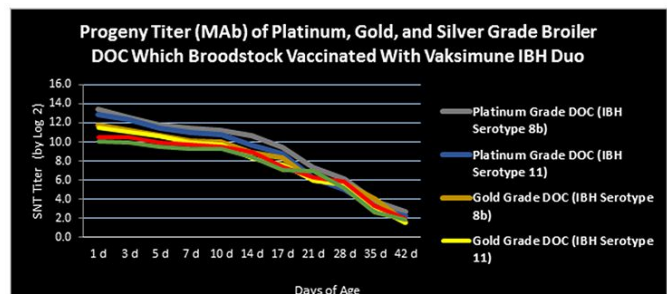

### 1. Optimal Solution to Boost Titer

To optimize the immunity against IBH, **Vaksimune® IBH Duo** also able to boost the protection by applying booster vaccination after the first vaccination. The titer resulted can be double in number compared to the initial titer before the booster vaccination

### 2. Creating Maternal Antibody in DOC

**Vaksimune® IBH Duo** application in brood-stock can produce maternal antibody in DOC. A trial showed that the maternal antibody titer was detected until 42 days of age in all Platimun, Silver, and Gold grade of broiler DOC.

### 3. Higher Antibody Titer

A trial in a breeder farm with competitor product showed that **Vaksimune® IBH Duo** can produce antibodies higher than competitors can
